

Flow between the sub-basins of Charzykowskie Lake – modeling and measurements

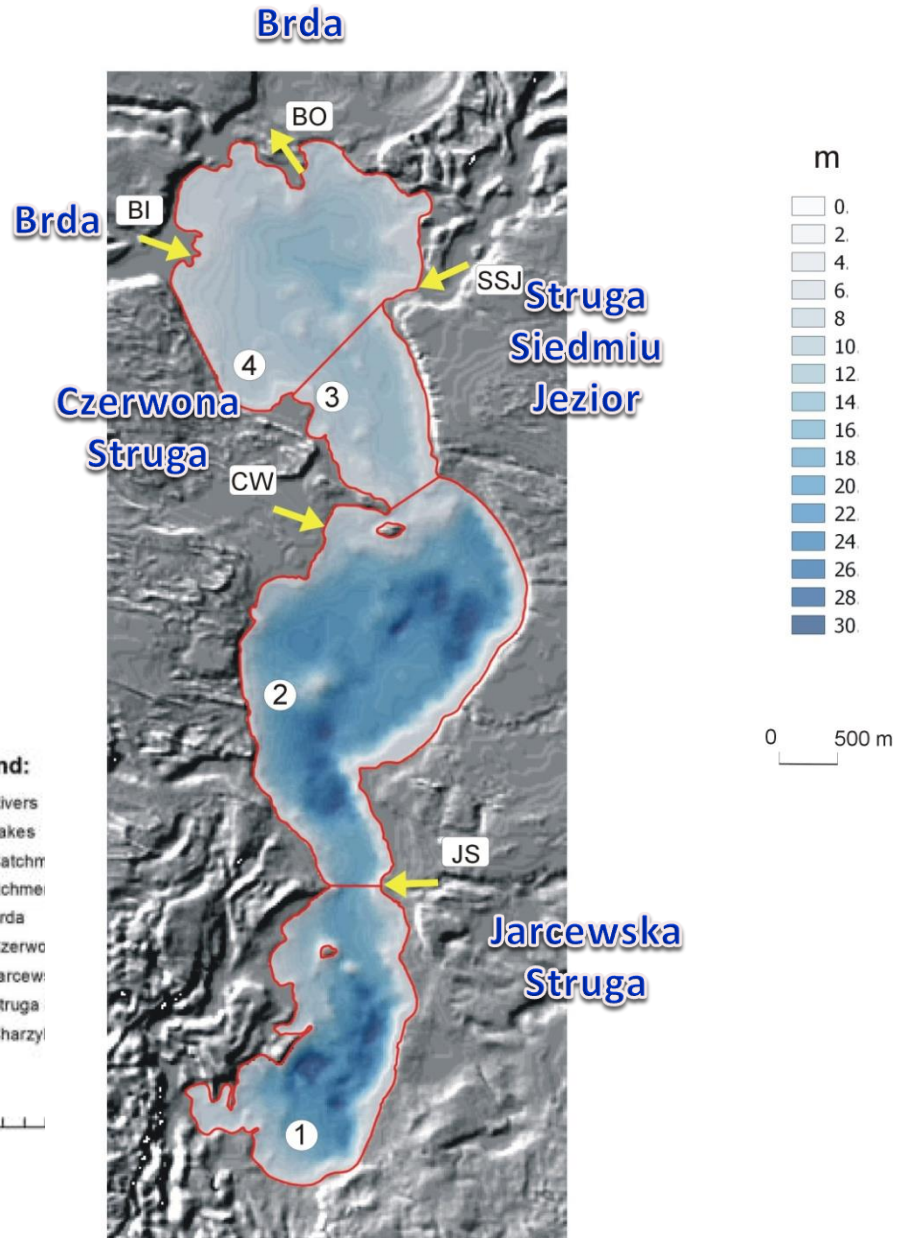

Artur Magnuszewski
Barbara Nowicka
WGSR UW

0 100 200 300 km

Sub-basin	Area km ²	Volume km ³	Average depth m
Southern	2.98	0.038	13
Central	5.49	0.083	15
Northern-2	1.36	0.010	7
Northern-1	3.69	0.026	7
Total	13.5	0.157	12

Parameters of the rivers in Charzykowskie Lake catchment

River (symbol)	Catchment area km ²	Discharge m ³ s ⁻¹			
		2015 08 21 field measurement	Mean low flow	Average	Mean high flow
		Inflow to Charzykowskie Lake			
Brda inflow (BI)	668	2.74	2.07	6.16	12.3
Czerwona Woda (CW)	78.8	0.05	0.00	0.20	0.41
Jarcewska Struga (JS)	58.0	0.12	0.11	0.42	0.64
Struga Siedmiu Jezior (SSJ)	41.0	0.26	0.05	0.21	0.33
		Outflow from Charzykowskie Lake			
Brda outflow (BO)	920	3.59	2.23	7.78	15.6
		Inflow – outflow difference			
Difference BO-(BI+CW+JS+SSJ)	36.8	0.85	0.16	1.62	3.30

Separation of the lake sub-basins

TP

The 1200 kHz RiverPro has been purpose-built to provide an ADCP designed specifically for shallow river applications (**20 cm to 25 m range**)

ASDCP mounted at zodiac rubber boat

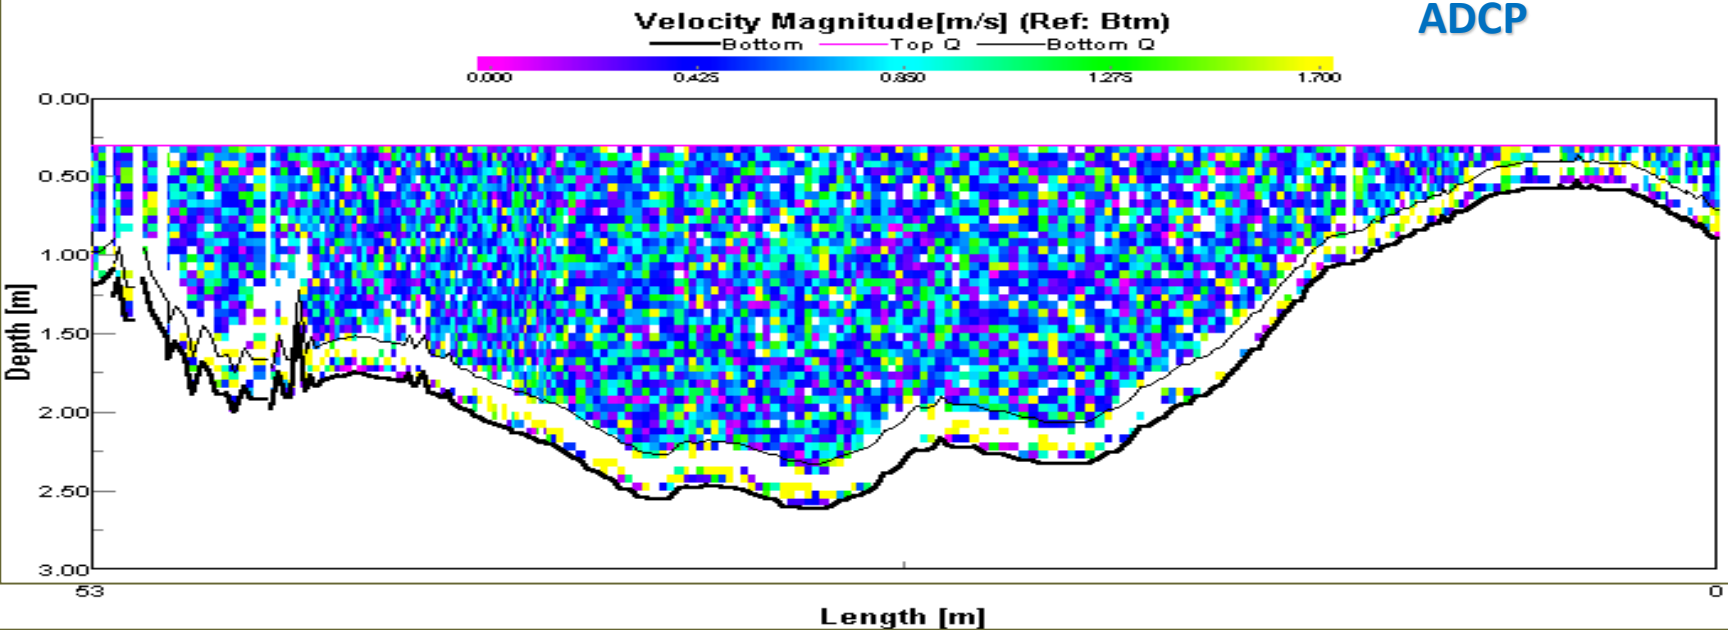

ADCP, echosounder and chart plotter QGIS

Rzeka: Brda Profil: Drzewicz
10.08.2005

Current meter profile

ADCP

Temperature °C

DOC mg/l

25 -26.08.2015

CCHE2D model

- computing mesh $i=100, j=100$
- average size of the grid 20x40 m

Velocity magnitude m/s

0 500 m

Results of ADCP measurements over the sill separating sub-basins Central and Northern-2 of Charzykowskie Lake performed on 2015 08 28

Passage No.	Width	Total Area	Top Q	Total Q	Flow velocity	Boat Speed
	m	m ²	m ³ s ⁻¹	m ³ s ⁻¹	m s ⁻¹	m s ⁻¹
9002	431.26	1612.34	0.026	3.216	0.005	0.974
9003	436.45	1638.29	0.858	1.475	0.013	0.906
9004	433.89	1588.13	0.152	1.634	0.004	1.025

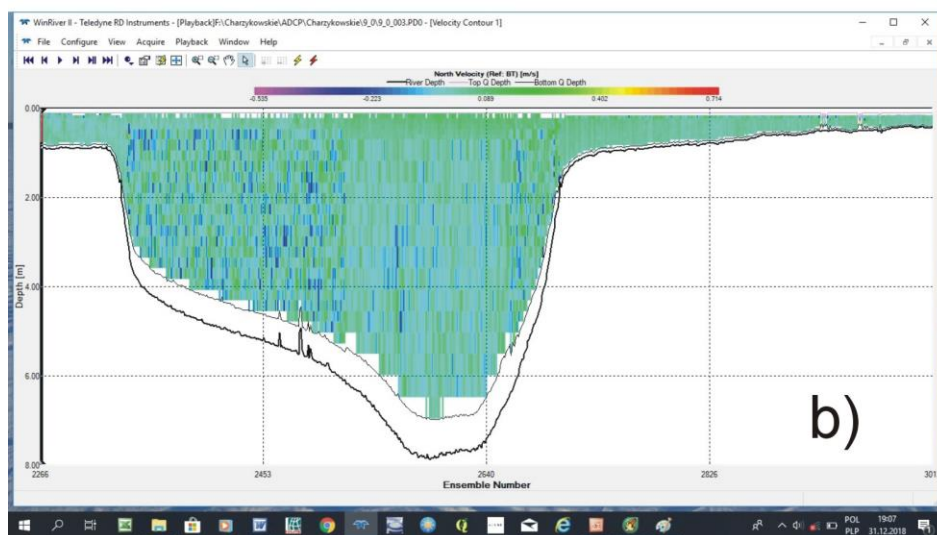

a)

North velocity magnitude

0 100 m

Direction of flow

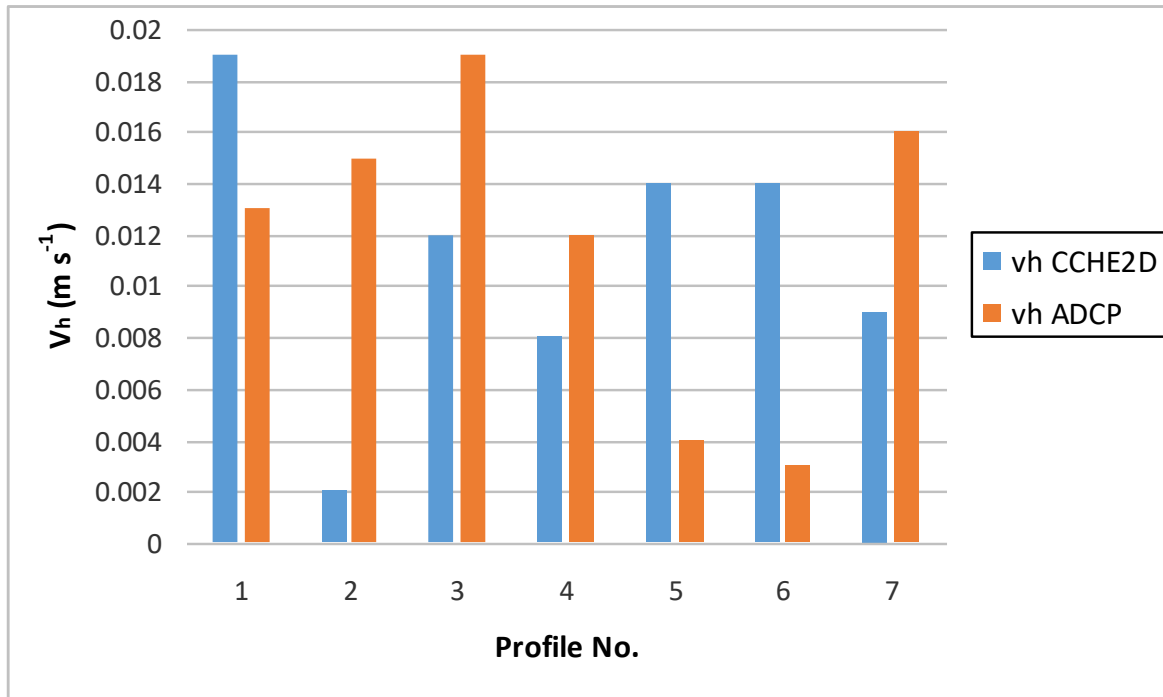

b)

c)

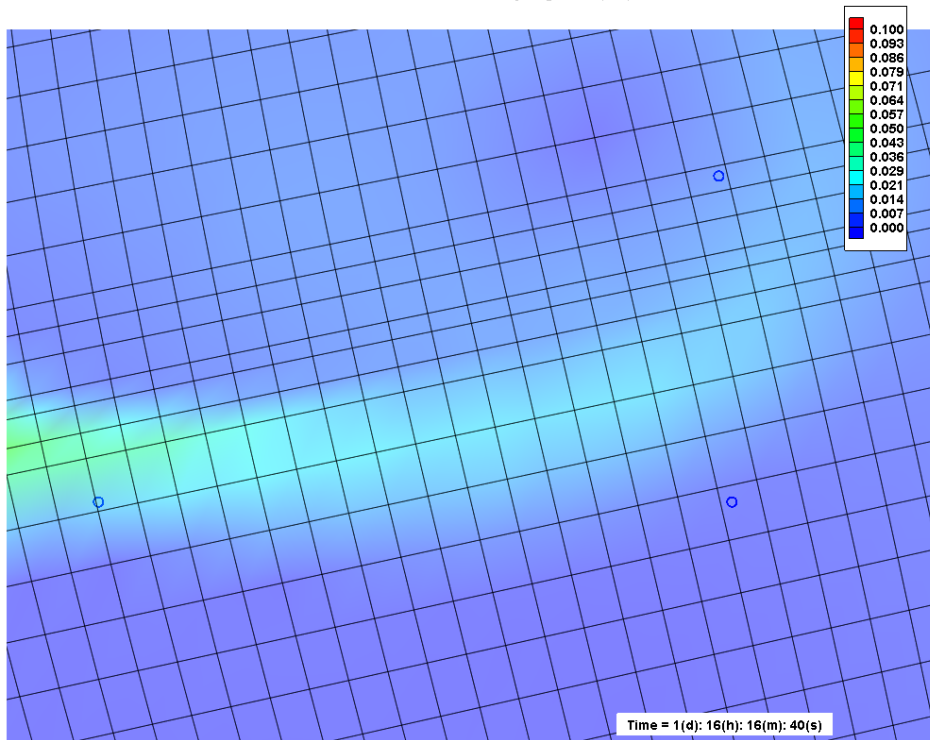

Velocity in verticals - calculated by CCHE2D model and measured by ADCP (section by section mode).

The average difference of performed ADCP measurements and CCHE2D results is only 0.002 m s^{-1} , which confirms the proper estimation of model calculated velocities.

Precision of localisation in the field and on the model grid

- grid of the model CCHE2D 40 x 20 m
- Quantum GIS + GPS Garmin +/- 5 m

Velocity Magnitude (m/s)

Conclusions:

- CCHE2D modeling and ADCP verification of flow pattern had confirmed a water flux between the sub-basins.
- Discharge values between the sub-basin Central and Northern-2 are higher than calculated from mass balance based on field measurements. But they are close to mass balance difference for a long term average conditions.
- In a moving boat method ADCP instrument shows properly the magnitude of velocities and the pattern of reverse flow. This property of ADCP instrument make possible to use the measurements results for hydrodynamic model verification and helps to understand complex pattern of flow in lake with separated sub-basins.
- Measurements section by section do not show proper direction of flow but velocity magnitude is good

Thank you for your attention
